BDNF–VEGF interplay key to rapid antidepressant actions

A study in Biological Psychiatry investigates the mechanisms of fast-acting antidepressants

Philadelphia, January 31, 2019 – A study by researchers at Yale University reveals a complex interplay of two different growth factors in the rapid and long-lasting antidepressant effects of ketamine. The study, published in Biological Psychiatry, reports that the antidepressant-like actions of brain-derived neurotrophic factor (BDNF) require the release of vascular endothelial growth factor (VEGF).

“Surprisingly, the reciprocal relationship was also observed, indicating that BDNF–VEGF interdependence plays a crucial role in the actions of rapid-acting antidepressants,” said senior author Ronald Duman, PhD.

Ketamine requires the release of both BDNF and VEGF to produce its rapid antidepressant effects, but the connection between the two growth factors—which have different functions and act through different mechanisms—was unknown.

Using mice to model behaviors of depression, the researchers investigated the interaction of BDNF and VEGF. Administering BDNF or VEGF to a brain region implicated in depression, the medial prefrontal cortex (mPFC), produces rapid and long-lasting antidepressant-like actions similar to those of ketamine. In the study, Dr. Duman and colleagues found that removing VEGF from the mPFC prevented the antidepressant-like effects of BDNF in mice. When they performed similar experiments but instead blocked BDNF, the antidepressant-like effects of VEGF were prevented.

Deeper analysis using neuron cultures to examine how the two factors depend on each other revealed that BDNF signaling stimulates VEGF release in neurons and requires VEGF to produce its neurotrophic effects. Conversely, VEGF stimulates the release of BDNF and requires BDNF signaling to produce its neurotrophic effects.

“This observation may have important clinical implications. VEGF inhibitors are widely used to treat various cancers and can be associated with increased risk for depression and cognitive impairments sometimes called the ‘fog of chemotherapy’.

“Since most antidepressant effects are mediated by BDNF, and therefore VEGF, how should we treat these forms of depression and cognitive impairments? The answer to this question may draw us to BDNF-independent effects of antidepressants and new insights into the biology and treatment of depression,” said John Krystal, MD, Editor of Biological Psychiatry.

The results provide the first evidence that reciprocal interdependence of BDNF and VEGF plays a crucial role in their rapid antidepressant-like effects, revealing key mechanisms of ketamine, which requires both
BDNF and VEGF. The findings also highlight avenues of research to better understand how each of the factors may affect a person’s risk of depression or their response to antidepressant drugs.

**About Biological Psychiatry**

*Biological Psychiatry* is the official journal of the Society of Biological Psychiatry, whose purpose is to promote excellence in scientific research and education in fields that investigate the nature, causes, mechanisms and treatments of disorders of thought, emotion, or behavior. In accord with this mission, this peer-reviewed, rapid-publication, international journal publishes both basic and clinical contributions from all disciplines and research areas relevant to the pathophysiology and treatment of major psychiatric disorders.

The journal publishes novel results of original research which represent an important new lead or significant impact on the field, particularly those addressing genetic and environmental risk factors, neural circuitry and neurochemistry, and important new therapeutic approaches. Reviews and commentaries that focus on topics of current research and interest are also encouraged.

*Biological Psychiatry* is one of the most selective and highly cited journals in the field of psychiatric neuroscience. It is ranked 6th out of 142 Psychiatry titles and 9th out of 261 Neurosciences titles in the Journal Citations Reports® published by Clarivate Analytics. The 2017 Impact Factor score for *Biological Psychiatry* is 11.982. [www.sobp.org/journal](http://www.sobp.org/journal)

**About Elsevier**

Elsevier is a global information analytics business that helps institutions and professionals advance healthcare, open science and improve performance for the benefit of humanity. Elsevier provides digital solutions and tools in the areas of strategic research management, R&D performance, clinical decision support and professional education, including [ScienceDirect](http://www.sobp.org/journal), [Scopus](http://www.sobp.org/journal), [SciVal](http://www.sobp.org/journal), [ClinicalKey](http://www.sobp.org/journal) and [Sherpath](http://www.sobp.org/journal). Elsevier publishes over 2,500 digitized journals, including *The Lancet* and *Cell*, 38,000 e-book titles and many iconic reference works, including *Gray’s Anatomy*. Elsevier is part of RELX Group, a global provider of information and analytics for professionals and business customers across industries. [www.elsevier.com](http://www.elsevier.com)
