The COVID-19 pandemic through the lens of a gastroenterology fellow: looking for the silver lining

On Tuesday, March 10, 2020, an institutional email sent from our hospital President confirmed the first 3 cases of COVID-19 in our healthcare system. Twenty-four hours later, we learned that one of our co-fellows had been exposed and was forced into self-quarantine. Suddenly, what had seemed to be a distant problem hit close to home. As we sat around the “fellows’ room” (socially distanced as much as possible in the luxurious expanse that is common to fellows’ quarters), the uncertainty about our future raised several questions. How would we be impacted as we journey through this global pandemic?

Thankfully, our colleague’s test was negative, but the episode sparked contemplation. We were worried about our loved ones while absorbing the jarring effects of the pandemic on our clinical and endoscopic training, as well as our in-person didactic learning. Herein, we share some thoughts and perspectives regarding the impact this has on our personal and professional lives. Additionally, we propose ways to maximize our educational and clinical growth as gastroenterology fellows while we continue caring for patients during this difficult time.

Effects on personal life

Challenges

On a personal level, some of us have children and are forced to consider the possibility of transmitting exposures through patient care to our families. In light of the present situation, many are unable to visit their families as they risk exposing their elderly parents and friends. Some medical personnel have been forced to move out of their homes and live in make-shift apartments or use separate rooms. Maintaining distance from loved ones to avoid causing them harm can be damaging to the mental health of trainees. This distancing also eliminates an important outlet for stress relief. Furthermore, there are increased demands for services such as babysitting, pet care, transportation, and groceries.

Implemented Solutions

It is vital to ensure our trainees are doing well from a mental health perspective. Many residency and fellowship programs already have established wellness programs and initiatives, and these must be advertised during these troubling times. Steps should be taken to ensure all fellows in need have the opportunity to pursue available resources at their institution and community. These may include wellness coaches, counselors, and virtual program leadership meetings. A coverage system may be devised, using fellows who were scheduled to be on research or endoscopy rotations, to ensure that clinical duties do not inhibit the pursuit of mental health resources. Additionally, volunteer programs can be designed to assist trainees in need of pet care, babysitting, transportation, and groceries. Fellows who are home, sheltering in place, can help with some of these needs for other fellows. Further, hospital and

1
2
3
4 departmental communication should focus on fostering a supportive environment, with
5 ongoing support of mental health resources.
6

7 **Effects on professional life**

8
9 On a professional level, the pandemic has wide-ranging effects on nearly all aspects of
10 gastroenterology fellowship training, both clinical and scholarly.
11

12
13 Impending serious impacts on medical trainees can be extrapolated from prior outbreaks such
14 as the severe acute respiratory syndrome (SARS) outbreak at the University of Toronto in
15 2003. The house staff at the time reported fear and worry due to frequent changes in
16 information about the disease and ineffective communication, social isolation, and a work
17 environment with increased stress.¹
18
19

20
21 Our current work environment is unsettling with guidelines and policies changing daily. We
22 will provide a brief outline of new challenges in each area and suggest approaches to
23 managing these difficulties (Tables 1 and 2).
24
25

26 *A. Clinical Education*

27 1. Inpatient rotations

28 Changes

29
30
31 Significant limitations on patient care have been put into effect in many hospitals across
32 the nation, stemming from a necessity to conserve personal protective equipment
33 (PPE), avoid unnecessary exposure, and be in compliance with the edicts of social
34 distancing. Widespread policy changes include limiting in-room patient contact and
35 withdrawing fellows from many endoscopic procedures. Although sensible, this
36 represents a major change from the standard clinical teaching paradigm, in which the
37 patient is seen first by the fellow alone and then again together with the entire team.
38
39
40
41
42

43 Implemented Solutions

44
45 Standard in-person pre-rounds followed by in-person rounds have essentially been
46 eliminated. Among institutions with the resources, some have implemented seeing
47 consults entirely via telephone or electronically to avoid or reduce patient
48 contact. Alternatively, in other institutions, patients are seen only during either pre-
49 rounds or rounds, but not both. When appropriate, at the discretion of the fellow or
50 attending, chart review and discussion with bedside nursing and primary teams may be
51 deemed sufficient, and direct patient contact by the consulting team is avoided
52 altogether for that day.
53
54
55
56

57 Perspectives

58
59
60
61
62
63
64
65

1
2
3
4 We are practicing in an environment of fear of exposure and limited resources and have
5 had to find ways to limit exposures and minimize the resources used. We have been
6 forced to consider ways to practice excellent patient care while limiting the number of
7 providers and instances of in-room patient contact. The solutions that various hospitals
8 come up with offer interesting food for thought in terms of how much of our practice
9 we do out of habit, as opposed to what is truly the most effective and efficient way to
10 deliver patient care.
11
12
13

14 2. Outpatient Clinics

15 Changes

16
17 In order to adhere to social distancing, “nonessential” clinic visits have been canceled.
18 Those deemed “essential” continue as in-person visits. The terms “nonessential” and
19 “essential” vary widely among healthcare providers. Contacting patients before a
20 scheduled appointment can be difficult and is potentially limited by the availability of
21 the provider as well as patient telephone access.
22
23
24
25

26 Implemented Solutions

27
28 Patients can be contacted by their providers before the scheduled visit to determine
29 whether virtual or telephone visits are appropriate. Telemedicine offers a means to
30 complete clinical encounters and maintain rapport while complying with the concept of
31 social distancing.
32
33
34

35 Perspectives

36
37 Although telemedicine is a useful solution, it is not without its problems. Some
38 institutions integrated it as part of their practice a long time ago. For others it is new
39 technology, and its implementation will be complicated by the challenges of learning a
40 new system. Technical issues may also arise, such as connection disruptions that can
41 make establishing rapport difficult. Furthermore, because this is a new technology for
42 some providers, it may be challenging to triage patients between in-person office
43 and telemedicine visits. This ability is crucial because precluding patients from a
44 necessary office visit may lead to increased emergency department visits.
45
46
47

48 On the other hand, this can be viewed as an educational opportunity. We will be forced
49 to become acquainted with the practice of telemedicine, something in which we would
50 otherwise have lacked experience. Even when normalcy returns, telemedicine might
51 gain an increasing role in medical practice. Our experience may allow us to incorporate
52 new skills into future situations that warrant telemedicine visits, such as patients who
53 lack adequate transportation. Additionally, this gives an opportunity to develop
54 competency to triage between those who need in-person office and virtual visits. The
55 solutions that have arisen out of this current crisis may continue to play an integral part
56 in the outreach of difficult-to-reach patient populations.
57
58
59
60
61
62
63
64
65

1
2
3
4 3. Endoscopy

5
6 Changes

7
8 A number of institutions have withdrawn fellows from most, if not all, routine
9 endoscopic procedures to preserve PPE, shorten procedure time, and limit exposure.
10 For a procedure-focused specialty such as gastroenterology, attaining and maintaining
11 competency in endoscopic skills has become a concern for fellows during this
12 pandemic. The concern is augmented by the indefinite time period we will be away
13 from the endoscopy suite. Because this is uncharted territory, there is fear of whether
14 this will pose a detriment to our acquisition of procedural skills.
15
16
17
18

19 Implemented Solutions

20
21 This is an opportunity to reflect on endoscopic techniques by using nonclinical time to
22 watch endoscopy videos, through *VideoGIE* and websites such as American Society for
23 Gastrointestinal Endoscopy (ASGE), work on a goal-directed endoscopy curriculum for
24 impacted fellows, and create a curriculum to use a simulator lab. To minimize use of
25 PPE but preserve educational objectives, fellows may be given the option to participate
26 in select cases such as removal of foreign body or therapy of gastrointestinal bleeding if
27 the patient is judged to be low risk for COVID-19.
28
29
30
31 .
32

33 Perspectives

34
35 Although we fear our endoscopic skills may be compromised, extended breaks from
36 endoscopy has precedence. For example, fellows on a research track and those who
37 take maternity or paternity leave have graduated as successful fellows. It is important to
38 keep in mind that endoscopy is both a cognitive and technical discipline. This
39 unfortunate circumstance provides the opportunity to develop the cognitive aspect of
40 endoscopy in ways that may not have otherwise arisen. We are involved in real-time
41 decisions on the urgency and necessity of endoscopic procedures we used to routinely
42 perform. The exercise of choosing which procedures offer high enough yield and benefit
43 to patients in the immediate setting to outweigh the risk of exposure and the use of
44 limited personal protective equipment is a valuable one. It has also given us a new
45 perspective on which endoscopic procedures really impact clinical management and
46 which procedures are less urgent.
47
48
49
50

51 *B. Academic Education*

52
53
54 1. Formal Didactics

55
56
57 Changes
58
59
60
61
62
63
64
65

1
2
3
4 Many areas of education have been affected such as multidisciplinary conferences,
5 lectures, and journal clubs, which have been delayed indefinitely.
6

7 8 Suggested Solutions

9
10 How can we maximize our educational experiences in these unconventional times? It is
11 possible to use the time gained from social distancing to focus on education in an
12 innovative way. In 2009, Lim et al² discussed the importance of re-imagining medical
13 education via online and simulation methods during a SARS outbreak and even
14 proposed contingency plans for a future outbreak. By learning from our past
15 experiences, we can mitigate the negative impact on medical education and implement
16 programs faster than before.² We suggest that gastroenterology programs use virtual
17 platforms for board review and conferences, continue with journal clubs with the help
18 of social media, and encourage the use of didactic videos for endoscopic procedures.
19 Some programs are sending educational materials to fellows to review.
20
21
22
23

24 Perspectives

25
26 There will be a learning curve associated with using virtual platforms. Information
27 technology can provide tutorials to assist in creating an effective virtual environment to
28 maximize education. Faculty and fellows who are familiar with social media platforms
29 can assist those unfamiliar in their use. It is also interesting to note that during the SARS
30 outbreak in Toronto in 2003, limited social media platforms were available and not used
31 as commonly. With the advent of Twitter, for example, we can participate in a journal
32 club with leaders in the field of gastroenterology from around the nation and globe.
33 Through *VideoGIE* and YouTube, we can watch endoscopy cases and discuss them in the
34 comments section. These platforms along with many others can provide a key
35 component in minimizing educational lapses.
36
37
38
39
40

41 2. National and Regional Conferences

42 Changes

43
44 The cancellation of major conferences, including Digestive Disease Week (DDW),
45 decreases opportunities for networking and leaves many feeling that their hard work
46 will go unnoticed.
47
48
49

50 Suggested Solutions

51
52 Although the cancellation of regional and national conferences is disappointing, there
53 are novel alternatives for research presentation and dissemination. Examples include
54 the planning of a future de novo regional presentation day in which trainees would have
55 the opportunity to showcase their work. Similarly, the creation of a virtual conference
56 would allow us to network and disseminate our research findings during this time of
57 social distancing.
58
59
60
61
62
63
64
65

1
2
3
4 Perspectives
5

6 Creating a “virtual” conference would potentially allow conference registrants to
7 present their research that was accepted to now-canceled meetings. Our GI societies
8 have online education resources (eg, ASGE GI Leap, DDW on demand) that could be
9 used to facilitate virtual research presentations. This avenue, however, has inherent
10 limitations such as suboptimal or absent audience interaction, lack of widespread
11 interest, and inability to participate in hands-on workshops. Another medium to
12 facilitate virtual research dissemination is through social media; however, this is not
13 universally used and would present a new logistical challenge. This may be surmounted
14 through dissemination of tutorials on appropriate use of social media. If a virtual
15 conference can be effectively done, this may provide an interactive option to use for
16 years to come for those unable to attend the conference. We hope that the ASGE
17 leadership will recognize this need and offer a solution once the pandemic is controlled.
18
19
20
21
22
23

24
25 3. Research

26
27 Changes

28
29 During this precarious time, fellows are still at increased risk for exposure and time away
30 from clinical duties. A number of programs have instituted a precautionary coverage
31 system, which has the potential to limit research time. Furthermore, patient
32 recruitment may become limited or has ceased, and clinical research personnel may be
33 unavailable.
34
35

36 Suggested Solutions

37
38 Although conducting clinical trials that require patient recruitment will be limited or
39 halted, survey studies, pilot grants, database research, online courses in statistical
40 methodology, systematic review and meta-analyses, or chart review through remote
41 access are other methods to continue with clinical research.
42
43

44 Perspectives

45
46 Despite limitations in conducting randomized controlled trials, some fellows may find
47 more time that can be allocated toward other types of research or learning new skills.
48 Acquiring data through the combination of social media data and electronic health
49 record data may be an innovative method to continue research endeavors.³
50 Furthermore, crowd sourcing is another method that can be used. There has been
51 success with the use of such tools in prior gastroenterology research.⁴ Artificial
52 intelligence is rapidly altering the endoscopy landscape, and much research can be done
53 using existing image and video repositories, even in the current restrictive environment.
54 Moreover, collaborative research projects may provide an opportunity to interact with
55 peers in a stimulating academic environment while complying with social distancing.
56
57
58
59
60
61
62
63
64
65

1
2
3
4 Virtual and telephone meetings in the spirit of research can allow for a gratifying
5 experience.
6

7 **Conclusion**

8
9
10 “Quarantine, self-isolation, COVID-19 rule-out, social distancing.” These words have become
11 modern colloquialisms. However, this is a time when we can still present a united front in
12 fighting a pandemic while simultaneously maintaining morale. We encourage all programs to
13 share their experiences and solutions during this rapidly changing landscape. In these
14 unprecedented times, we can still ensure our success in becoming well-trained
15 gastroenterologists by working together, taking advantage of unique opportunities, formulating
16 novel solutions to new problems, being innovative, and always looking for the silver lining.
